

Impact of the COVID-19 Pandemic on the Movement Behaviours of Canadian Children and Youth with Disabilities: 6-Month Follow-Up Survey Results

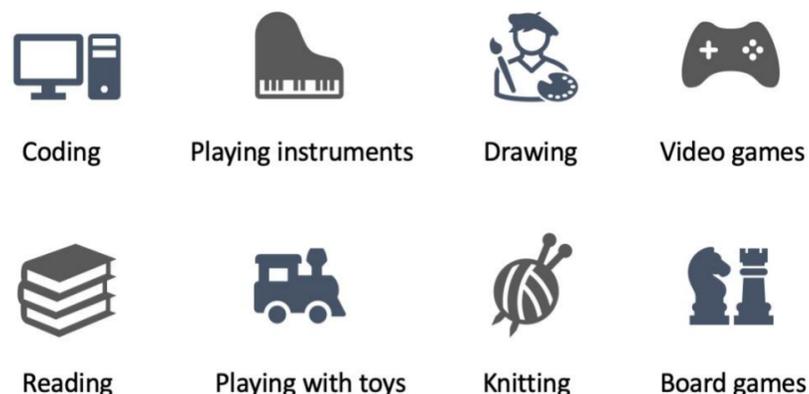

In Fall 2020, researchers from the National Physical Activity Measurement (NPAM) Study[†] conducted a follow-up survey among 87 parents of a child with a disability to understand how the COVID-19 pandemic has continued to impact their child's movement behaviours (i.e., physical activity, sedentary behaviour, and sleep) and overall health.

In comparison to before the pandemic and related restrictions:

Despite these challenges, children and youth, and their families, started new indoor and outdoor hobbies!

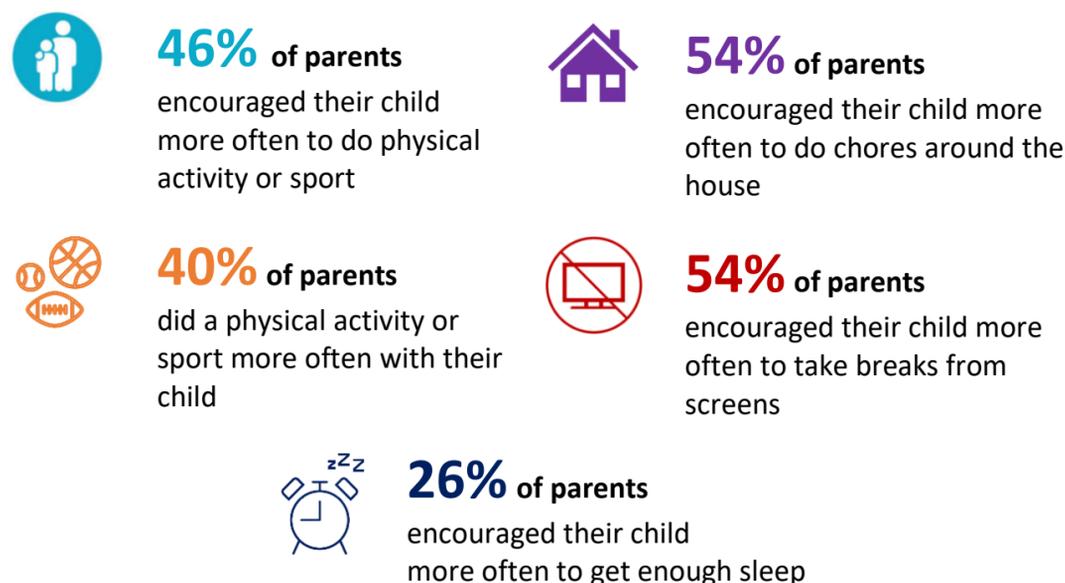

Every day is different as we continue adjusting to the pandemic. Staying active and reducing sedentary behaviours is a commonly experienced challenge, especially now with restrictions on recreation and programming. What matters is being mindful of finding the appropriate balance of physical activity, sleep, and sedentary behaviours for your child.

Although we should try to reduce our time spent using screens, it's a normal part of life and is how many children are currently attending school and staying socially connected.

Encourage your child to take mini movement breaks away from the screens throughout the day. Try a stand break, using a stander, or playing around the house!

It's important to get outside and enjoy the fresh air and sun, even for just a few minutes. These small breaks will provide several benefits to you and your child's health!

Parents play a key role in supporting their child's movement behaviours! In comparison to before the pandemic and related restrictions:
